

## **AI is threat to Humanity**

AI that is short for Artificial Intelligence is the scientific knowledge of the mechanism that underlies cognition and intelligent behavior and its integration in machines. In simpler words, we can say that AI is the phenomenon in computer science that enables machines to have diverse attributes of human intelligence. This is to say that they can imitate human behavior. The concept of AI has been a very crucial and controversial matter of discussion among the people in different fields. And I, take a stand on for the topic that AI does indeed possess threat to humanity.

Currently, there are about 9% of total human population of the world living under poverty and about 19% of the people surviving on the daily wages. These people work on different industries, factories or other places. However, till today's date approximately about 30% of these jobs and their tasks is being carried out by machines and AI and industrial experts believe that AI and robots will replace 40% in about 15 years. So, the people who live off their daily wages will eventually lose their only source of income and living to AI. That will then eventually increase the poverty and unemployment. The panel of 33 OECD countries investigated on the correlation of AI and unemployment and were able to give the result of evidential report that both AI and robots tend to increase unemployment. The AI is still in its growing phase and has yet to develop. Until today the AI is under the control of humans but the rapid advancement and development of AI can also very soon result in AI being above the human creation and cause unbeatable damage to humanity and human mankind.

In conclusion, although AI may make our life easier to certain extent it isn't human necessity nor the basic requirement for livelihood. However, humans are giving great importance to it and that might seem as achievement but we should never overlook its drawbacks.
